INPUTS

WEATHER SUMMARY:

Today will see another day of an inversion preventing smoke from lifting out of the fire area until the afternoon hours. The temperature will be 84-94 degrees and relative humidity 12-22% during the day. Overnight the temperature will be 65-77 degrees and relative humidity 28-40 percent. Wind during the day will be southeast becoming southwest 7-10 mph in the afternoon in the valleys/slopes and southwest 6-10 mph on the ridges. The overnight hours will bring northeast winds in the valleys/slopes and west to southwest wind 6-10 mph on the ridges.

Probability Of Ignition: 90-100% Day 60% Night

OUTPUTS

FIRE BEHAVIOR

GENERAL:

The fuels in the north and east portions of the fire is a mix of oak woodland with a grass and brush understory and fields of brush with a light grass understory. The fuels to the west and south are dominated by grass with a sparse oak overstory. The fuels are highly stressed and the fuel moisture in the brush is at critical levels, below 60 percent. Single and group tree torching during peak burning conditions will create spots 1/2 to 3/4 of a mile away. The head of the fire is progressing at a rapid rate of spread and will increase when in the open grass areas influenced by the wind. The slopes and ridges influenced by the wind have complete consumption of the fuels. The backing and flanking fire is dominated by surface fire with occasional torching of individual trees. The temperature will lower today with a slight increase in humidity, however this will not have an effect on the fire behavior, due to the fuel conditions. The slight moderation in weather will have little effect on the fire since the larger fuels will carry the fire.

SPECIFIC:

The northeast portion in the Mokelumne River drainage will be active with a southwest wind increasing spread to the east. The drainage splits into two main branches with a dominant ridge in-between. If fire becomes established in both sides of the canyon there will be two separate head fires. The east side of the fire has transition areas from trees and brush into grass fields. Spotting into these fields is a strong possibility. These spots will have a rapid rate of spread and will transition again into brush and timber. The south portion of the fire is in the grass oak woodland, which has the high potential for spot fires, however the wind should be more favorable for control efforts. The east side of the fire is also in the grass oak woodland and will have favorable winds during and changing directions across the line in the overnight hours. Spotting potential will be reduced in the overnight hours but is still a strong possibility.

AIR OPERATIONS

Air operations will be limited until the smoke lifts out of the area in the afternoon.

SAFETY

The cooler weather will not have a dramatic change in the fire behavior due to the lag time in the heavier fuels. Continue to monitor your surroundings for spot fires.

Incident Location
County Amador State-CA Latitude N Longitude W

The convention calls for frequency lists to show four digits after the decimal place, followed by either an "N" or a "W", depending on whether the frequency is narrow or wide band. Mode refers to either "A" or "D" indicating analog or digital (e.g. Project 25) or "M" indicating mixed mode. All channels are shown as if programmed in a control station, mobile or portable radio. Repeater and base stations must be programmed with the Rx and Tx reversed.

The convention calls for frequency lists to show four digits after the decimal place, followed by either an "N" or a "W", depending on whether the frequency is narrow or wide band. Mode refers to either "A" or "D" indicating analog or digital (e.g. Project 25) or "M" indicating mixed mode. All channels are shown as if programmed in a control station, mobile or portable radio. Repeater and base stations must be programmed with the Rx and Tx reversed.
