

Dates modeled: 8/8-8/14
 RAWs used: Alder Springs RAWs (winds are predominantly SSE)
 Ignition File: Intense Heat from 8/07 23:55 fight.
 Burn area within fire perimeter was masked as unburnable.
 2000 fires at 120m resolution. This run uses Alder Springs RAWs for wind and ERCs. The ignition file used was the intense heat and VIIRS input for later day heat probability. Landscape was edited for TUS decreasing any canopy closure at 75% to 65%. Fuels in the 2012 Mill Fire were changed to GS2. TUS was converted to TL3 above 1100m based on observations around Letts Lake. This could cause an underprediction in the South Fork of Stony Creek and Letts Creek. Model assumes no suppression, and only one barrier fire was used to represent the dozer line between DP-31 and DP-33. If burnout operation are successful between DP-33 and Indian Valley Reservoir, the entire southeast portion of intense heat will be contained.
