

*Outputs do not represent fire growth by progression. Each band represents the probability of fire affecting the area within anytime over the 7 day period.

080814_near Beaver river spot planning
 This spot scenario is indicated in the latest FsPro run as a rare event possibility. The near term run does not account for sustained north winds which would most likely be the cause of any spots across the river. The run does show a 4day progression of 8_8 through 8_11 predicted weather with a spot fire in the two most likely locations.
