Notes: 7 day FSPro analysis, 8/8 to 8/14. Masks 8/6 2240 IR perimeter as non-burnable and uses 8/7 1953 IR intense heat as ignition file to capture areas of recent fire growth. Barrier file used on 14N02 road. However the spread probability wraps around it on the north end because it is a partial barrier. Model assumes no suppression action. **Expect spread into low probability surfaces early in the analysis period due to extreme drought conditions and/or forecasted increase in SW winds.**

Outputs do not represent fire progression. They represent the probability of each 90 meter cell burning given 2,000 simulated fires under variable weather conditions. Weather inputs are based on 2 days of forecasted weather and 5 days of climatology.
