## **INPUTS**

# **FIRE BEHAVIOR**

# **GENERAL**

Warm temperatures and low relative humidity, coupled with afternoon winds, may result in moderate to extreme fire spread. The fire behavior has the potential to be moderate to extreme throughout the day into the late evening until winds subside and humidity starts to recover.

ERC levels on most surrounding RAWS are above the 90th percentile.

The primary carrier on the Loyalton Fire is the grass and shrub fuels. The majority of the timber stands and stringers at the higher elevations should be within the interior of the fire.

### SPECIFIC FIRE BEHAVIOR

Grass/ Shrub fuel types. Anticipated rates of spread during the critical burning periods are 30 to 50 chains per hour. When slope is aligned with the wind the upper rates of spread could potentially exceed 50 chains per hour. Flame lengths 6-10' with spotting up to 3/10 of a mile. Probability of ignition 80-90%. **During any outflow wind occurrence, expect rates of spread to dramatically increase**. The fire on 8/15 spread approximately 4-miles in 3 hours.

Mixed timber fuel with sage and bitterbrush types (Div Z/R): Anticipate moderate to high rates of spread with spotting. Unburned areas of timber are receptive and quickly may result in single to group tree torching.

# **AIR OPERATIONS**

Air operations could be impacted by smoke inversion but breaking around 1100. Strong outflow gusts from smoke plume and surrounding thunderstorms may also affect air operations.

Sunrise: 08/17 06:15

Sunset: 08/17 19:53

## SAFETY

When developing strategies and tactics, safety zones and escape routes, you should be evaluating potential fire behavior (worst case scenario), not just observed fire behavior. The predicted thunderstorm activity and related outflow winds can result in extreme fire behavior today.
