### WEATHER SUMMARY:

**Max temperature**.....87° - 94° valleys, 79° - 85° ridges.

**Min humidity**.....20-30 % valleys, 25-35% upper ridges.

**20-foot winds**.....

**Slope/Valley**...Downslope <4 becoming Upslope 3-5 gusts 8 in the afternoon.

## OUTPUTS FIRE BEHAVIOR

### GENERAL:

The fire's main influence is heavy dead and down and steep topography. The fire is burning in pockets of fuel that haven't seen fire in 60 years. Fuels consist of moderate to heavy stringers of mixed conifer, snowbrush, white thorn and Manzanita. Brush LFMC at 120%. Conifer 160%. Many large rock scree areas exist. The fire has been dependent upon slope and wind alignment. Group torching to short duration crown transition has developed with headfire. Spotting distance up to 1/4-1/2 mile with crown fire spotting out to 1 mile. Rollout potential exists. Surface fire spread 6-12 ch/hr with headfire and around 1-3 ch/hr backing and flanking.

**Flame lengths 1-3ft, FDFMC=15-20% in the AM, 3-6% by late afternoon, 1000 hr fuels are at 7-9%**

### SPECIFIC:

**Wallow Fire:** Fire spread potential will increase throughout the day. Potential to threaten control lines in the afternoon due to drying. Fire spread will be limited to the Northeast down Patterson Creek drainage. Continued fire spread potential Southwest down Crapo and Morehouse drainages toward Forks of Salmon and Sawyer Bar Road. Surface fire to crown transition is possible in areas exposed to the wind. Identify wind and slope alignment for increased fire spread.

**BRANCH 1:** Surface fire spread. Rollout could still challenge control lines.

**BRANCH 2:** North to Northeast winds could cause the fire to challenge existing control lines as fuels dry out throughout the day. Surface fire spread transition to crown potential when aligned with wind/slope. Rollout could still challenge existing control lines.

**BRANCH 3:** Winds should support control lines at Snoozers Ridge and Etna Mill Creek. Fuels will dry out throughout the day to support fire activity within control lines. Rollout could still challenge existing control lines.

**BRANCH 5:** Fire will continue spread toward Tanner Peak, Little North Fork, Forks of Salmon, Sawyers Bar Road. Creeping and Backing down slope/canyon expected. Rollout can enhance this fire movement potential when aligned with wind or slope.

**Deep Fire (DIV AA):** North to Northeast winds will put fire in alignment with canyon/slope. Surface fire spread transition to crown possible as sun exposure dries fuels throughout the day.

**Garden / Grizzly / Mary / Rush / Clair / Fourth:** None to Minimal fire growth is anticipated.

### AIR OPERATIONS:

Smokey conditions today could limit aircraft use throughout the operational period.

## SAFETY

- Fuels will remain receptive to fire spread due to low 100 hour and 1000 hour time lag fuels moistures.
- 1 and 10 hour fuels will dry throughout the day as exposed to sun and wind.
- Keep situational awareness up for an increase in fire activity as fine dead fuel moistures drop.
- STOP = Stop Think Observe Predict.

### Hazards & Risks

**Safety Reporting:** Safety Officers can't be everywhere or see every safety problem. It is incumbent upon every individual to make safety a priority in their daily work assignments. Please bring concerns or issues to the attention of a safety officer in order to maintain a safe working environment for all personnel.

**Medical Emergency Plan:** REVIEW IT and know it!! Before you need it.....

4. UNFAMILIAR WITH WEATHER AND LOCAL FACTORS INFLUENCING FIRE BEHAVIOR

**Fatigue and Work-Rest:** With many crews coming from other incidents and/or beginning to time out, cumulative fatigue is a growing safety concern. Ensure your drivers are well rested. Give periodic breaks to personnel out on the line and provide adequate time for meals, showers and sleep for those coming off of shift.

**Aviation: Long-line Missions:** There are specific training and equipment requirements for long-line missions. Ordering a long-line flight will require a designated ground contact, Lat/Long location, cleared drop off/ pick up site, cargo weight and the ability to provide the pilot with wind speed & direction. Additionally, cargo net and swivel equipment are required. Review your IRPG for specific directions for long-line operations (pg. 52).

8. Location	9. Hazard	6. Control or Abatement Action (Engineering, Administrative, PPE, Avoidance, Education, etc)
M, T, V, Y	Structure Protection & HAZMAT	Review "Wildland Urban Interface" Watch outs, IRPG. Use "Structure Assessment" checklist, IRPG. Follow "HAZMAT Incident Operations" in IRPG.
ALL	Extreme Fire Behavior	Share weather observations with all personnel assigned to division. Establish "Trigger Points" to withdraw. Use "Risk Management" process prior to engaging in suppression actions; refer to IRPG.
ALL	Hazard Trees	Follow "Hazard Tree Safety" guidelines, IRPG. Post lookouts, or use a spotter in mop-up areas with personnel. Don't park vehicles or take breaks in high concentrations of hazard trees. Establish trigger points for disengagement during high wind events. Remember that the hazard zone extends a minimum of 2 1/2 tree heights.
ALL	Air Operations	Follow "Aviation Watch-Out Situations", IRPG. Don't plan on air resources for medical transport or resupply. Refer to IRPG for directing bucket drops. Ensure positive communication with all air
AA, A / D	Spike Camp/Coyote	Keep camp clean and free of trash and food scraps. Consider communications and evac plan. Reference IRPG for Line Spike.
ALL	Indirect Fireline	Post lookouts, identify escape routes and safety zones; refer to IRPG . Review "Strategy/Indirect Attack" in the IRPG.
ALL	Steep Terrain & Rolling Debris	Maintain 8'-10' spacing when working & walking. Don't work above any personnel. Be on the lookout for rolling rocks, debris, or burning material. Evaluate necessity to send personnel in areas with limited access. Post lookouts maintain LCES.
ALL	Spot Fires	Size up prior to engagement. Watch for multiple spot fires. Ensure LCES is in place. Maintain situational awareness at all times.
ALL	Communications	Maintain communication with aviation resources, and suppression organization. Ensure all know frequency and protocol for contacting resources. Utilize the ICS 205. Utilize human repeaters when working in dead spots.
ALL	Fatigue & Over Exertion	Drink 1 quart of water each hour during and after work. Rotate crews out of smoky areas. Set a reasonable work pace and allow adequate rest breaks while on the project. Stagger work crews start time to limit fatigue. Use buddy system to monitor personnel of heat related and fatigue issues. Follow work / rest guidelines.
ALL	Heat Related Illness (HRI)& Dehydration	Drink Fluids throughout operational period (6-8 qts/shift). Maintain water/electrolyte ratio of 3 to 1. Carry extra water on line and cache water at drop points. Take Frequent breaks, minimum of 10 minutes every hour. Allow out of area resources time to acclimatize before expecting peak performance. # Salmon August Complex – 17KNF006081

## CAL FIRE Fire Suppression Repair Plan

### I. Objectives

The objective of Fire Suppression Repair is to mitigate possible adverse effects to resources resulting from fire suppression activities during the Salmon August Complex *in a manner that shall not compromise the safety of those involved in repair activities*. CAL FIRE will consult with agency cooperators and other stakeholders as needed. A repair specialist (RESP) or their designee will be assigned to ensure that work is done as required and according to the Plan. Repair Specialists will ensure that work is completed in an efficient and cost-effective manner. Resources will be released and/or reassigned promptly upon completion of Fire Suppression Repair activities.

### II. General Repair Guidelines

#### A. Helispots/Staging Areas/Safety Zones/TRA's

- 1) Re-contour to the original slope as requested by the Repair Specialist or monitor.
- 2) Remove soil and/or breach berms so that runoff can be dissipated. Cross drain these areas to effectively dissipate water runoff.
- 3) Place disturbed vegetation that was piled during line construction on the surface of safety zones and open areas as directed. This may be done with equipment or hand crews.

#### B. Roads

- 1) Repair roads to protect against erosion as requested by the Repair Specialist or designee. Repair Specialists may identify specific locations to install or repair existing waterbreaks, rolling dips or critical dips along roadways.
- 2) Re-establish existing berms where applicable to protect watercourses.
- 3) Breach berms to facilitate drainage, where applicable.
- 4) Clean culverts plugged with soil and rock resulting from fire road use.
- 5) Remove all slash and debris from culvert inlets/outlets.
- 6) Blading or grading of roads may be necessary. Grading shall be done after all suppression repair work is completed for areas accessed by the roads being graded.
- 7) Water roads as necessary for dust abatement.
- 8) Where vegetation was cut and deposited within 100 feet of permanent roads accessible by the general public, it shall be lopped and to a depth no greater than 30" of the soil surface and scattered on the exposed soil for erosion protection or masticated as directed.
- 9) Roads, trails or fire lines on public lands opened or constructed during suppression may need to be closed to prevent OHV access. Place barriers such as boulders, trees, vegetation, and/or "tank traps" across access points.

#### C. Firelines; Hand and Dozer

- 1) Install waterbars as described in the guidelines below. Waterbars are designed to intercept, slow and spread the precipitation run-off in order to reduce sediment transport and soil erosion. The idea is to move water off the fireline before it can build up enough energy to erode and transport sediment. Re-establish waterbars and rolling dips to provide adequate drainage using pre-fire locations.

##### Waterbar Guidelines

- a. **Spacing:** These spacing distances should be used as a guide. Judgment should be used in locating waterbars to minimize erosion potential. It may not be possible or necessary to place waterbars in steep or rocky areas. Install water-bars at the following recommended **minimum** intervals:

b. Fire line Gradient c. (% slope)	d. Minimum Distance Between Water-Bars (feet)
e. 0 to 10	f. 200
g. 11 to 25	h. 100
i. 25+	j. 50

- b. **Location:** Construct waterbars at natural slope breaks and/or take advantage of natural features when possible. Direct water to unburned areas, and/or resistant surfaces with high vegetation cover when possible. Waterbars should extend beyond the width of the trail and discharge into undisturbed areas, rocky ground, or filter areas well protected with slash and vegetative cover.
- c. **Depth and Width:** Waterbars need to be cut into the ground surface; do not simply push up soil. On dozer-constructed line, waterbar depths should be at least 6 inches. Total height from bottom of ditch to top of the berm should average at least 12 inches and not exceed 24 inches. On hand constructed lines waterbar depths should be at least 4 inches. Total height from bottom of ditch to top of water-bar should average at least 8 inches and not exceed 18 inches. The width of the waterbar channel should be enough to handle expected water flows and to avoid plugging when a normal amount of sloughing occurs.
- d. **Angle:** Determine the average gradient in percent slope of the fire line being waterbarred. Add 5 to the average gradient. This approximates the angle in degrees for the water bar. Do not install water bars at an angle steeper than 45 degrees as this will increase water velocity rather than slow it down.

- 2) Spread berms back onto fire lines to match natural contours. This will restore native seed source back to disturbed ground and prevent erosion.
- 3) Where able, spread cut vegetation back across lines for erosion control.
- 4) Coordinate with READs, RESP's, or their designee(s) for site specific measures on public lands.

#### **D. Watercourses**

- 1) Watercourse crossings along roads and dozer lines should be dipped and returned to their original configuration, as feasible. Waterbreaks shall be installed on each side of channel to lessen the likelihood of sediment delivering to the watercourse.
- 2) Remove all soil and debris that was placed in any stream channel. A Repair Specialist will review the site for acceptability. If all foreign material cannot be removed with heavy equipment, the material shall be removed by hand. The approaches to the crossing shall be sloped back to prevent future stream bank failure.

#### **E. Archaeological or Historic Sites (if discovered)**

- 1) All known sites and potential sites shall be flagged and avoided to the furthest extent possible according to protection measures established by existing site records and/or RESP instructions.
- 2) Operations will stop immediately and the Division/Group Supervisor or Suppression Repair Specialist will be notified if any pre-historic, historic, and/or cultural sites are discovered.

#### **F. Other Repair Concerns**

- 1) Remove all trash from fire lines and other affected areas.
- 2) Collect and return ALL hose, including damaged portions, to the supply unit.
- 3) Repair damaged fences and/or gates damaged as the result of the fire control operations. Extent and condition of damage should be documented prior to repair. Consideration must be given to the pre-existing condition of fences and gates in the immediate vicinity that were not affected by official firefighting activities.
