FIRE BEHAVIOR FORECAST

INPUTS

WEATHER SUMMARY: ***See attached Fire Weather Forecast***

Discussion: Weak high pressure remains off Northern California today with warm and dry conditions. Mostly sunny skies are expected for today with a few buildups in the afternoon.

Weather: Mostly sunny in the morning becoming partly cloudy with a few buildups in the afternoon.

Max Temp: 78 - 88°

Min RH: 18 - 28%

Winds (20 foot): upslope 3-6 mph on lower to mid slopes becoming upcanyon 4-8; west 8-12 mph with gusts 15-20 after 1600. Ridge winds W 5-10 mph, becoming W 10-15, gusts 20-25 after 1600.

FIRE BEHAVIOR

GENERAL

Higher temperatures, lower relative humidity, and an increase in afternoon winds will result in an increase in fire behavior. Areas located within the fire perimeter are expected to exhibit minimal fire behavior: backing, flanking, occasional interior torching where jackpots of heavy fuels exist. Unsecured lines, undetected spots, and hold-over lightning fires may become active with the drying trend expected over the next several days.

SPECIFIC FIRE BEHAVIOR

Expect the fire behavior to be minimal until the afternoon. An increase in winds will increase the potential for fire activity late in the day outside the fire perimeter should a viable ignition source be present.

Timber fuel types: potential worst-case surface fire spread early will be 2-5 chains/hour with flame length 2-4 feet. In the afternoon expect an increase to 4-6 chains/hour and flame length 4-6 feet with the possibility of torching and short duration crown runs. Spotting distance will be less than 1/10 mile, probability of ignition 50-60%.

Grass/sage types: where continuous dense fuelbeds exist, potential worst-case surface fire spread early will be 5-10 chains/hour with flame length 1-3 feet. In the afternoon expect an increase to 15-25 chains/hour and flame length 4-6 feet. Spotting will be short range with distances well under 1/10 mile. Probability of ignition at the peak of the burning period will be 60-70%.

AIR OPERATIONS

Air operations should not be limited today.

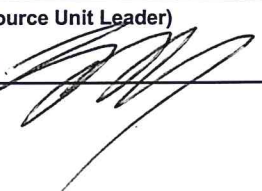

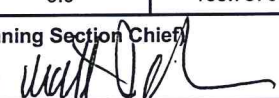

Sunrise: 06:08

Sunset: 20:05

SAFETY

- On a hillside where rolling material can ignite fuel below. Think about how the steep slopes on the fire may affect your plan or your ability to react to changing conditions.
- Pay attention to changing weather conditions that influence fire behavior, especially wind speed and direction.
- Warming and drying weather conditions will result in increased fire behavior. Don't let the last several days of generally mild conditions contribute to complacency.

Appendix A Effective Waterbars

When locating and building waterbars, place them the right **distance** apart, at a **diagonal** to the fire line, so they **divert**, then **discharge**, then **dissipate** the energy of the flowing water. Be sure to make them deep enough so they'll be durable, and that soil does **not block** the water bar outlet.

- Spacing: These spacing distances should be used as a guide. Judgment should be used in locating waterbars to minimize erosion potential. Install waterbars at the following recommended intervals:

Recommended spacing for waterbars on all hand and dozer lines

Fire line Gradient (% slope)	Distance Between Waterbars (feet)
1 to 5	200
5 to 20	125
21 to 40	60
41 to 60	40
>60	25

- DEPTH: Dozer line depth- Water bars should be 1 foot deep on the uphill side and 2 feet deep on the downhill side. Hand line depth - at least 4 inches deep total height from bottom of ditch to top of waterbars should average at least 8 inches and not exceed 12 inches. Handline waterbars should be at least two Pulaski widths wide.
- OUTLET: Water should be **directed to unburned areas**, and/or resistant surfaces with high vegetation cover when possible. Waterbars should discharge into undisturbed areas and preferably rocky ground or filter areas well protected with ground and vegetative cover, whether rocks or organic materials. Waterbars should not direct water into stream channels or roads.
- WIDTH: The waterbar channel should be enough to handle expected water flows and to avoid plugging when a normal amount of sloughing or sediment movement occurs.
- ANGLE: Waterbars should be placed at an angle relative to the fire line. The angle should be **between 30 to 45 degrees**. Angle is important, if the angle is too shallow, the water will slow down and deposit the sediment it carries in the waterbar making it ineffective. If the angle is too steep, water will continue at high velocity and be able to erode and carry additional sediment where it exits the waterbar.

Stage 1 Field Guide

General Repair Guidelines Include:

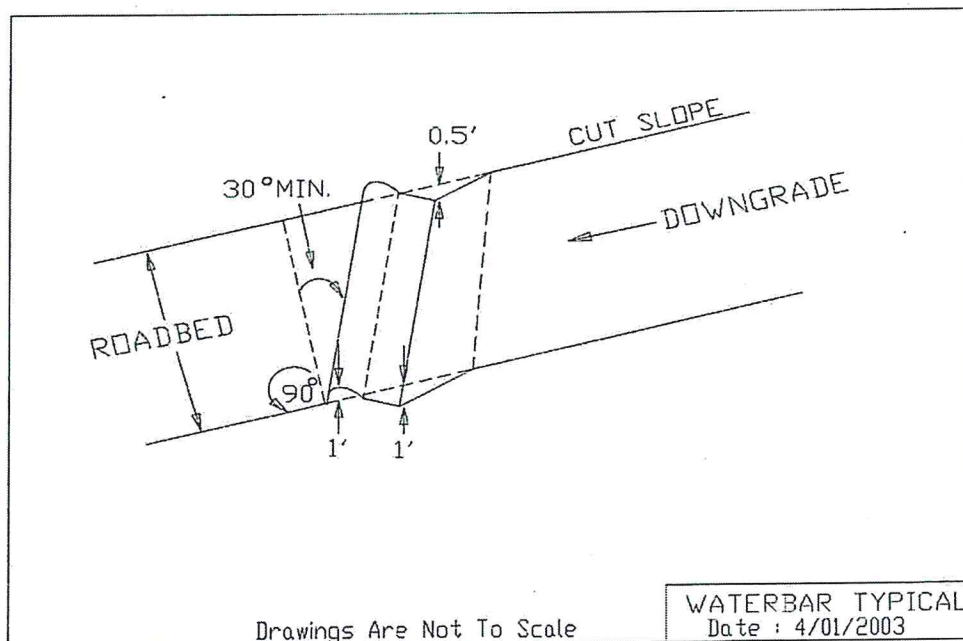

- Wash all heavy equipment and support vehicles before entering a repair site.
- Keep all Drop Point signs up until Stage 1 repair work is complete.
- During suppression, repair care should be taken to not damage live trees.
- No debris will be put back on primary control lines at this time unless Operation or the IC specifically authorize this operation in the Incident Action Plan.
- Construct waterbars on all dozer and hand lines including appropriate vehicle barriers where dozer lines intersect with Forest System roads. (See Appendix A)
- Restore forest roads to pre-fire status (See Appendix B)
- Remove all flagging, garbage, litter, and equipment.
- Repair any fences cut or damaged by fire suppression resources as identified on the repair map.
- All equipment and supplies associated with fire suppression will be removed from the fire lines and dispersal sites, such as drop points and staging areas
- Private water sources used by the incident if required will be replaced at the water source or paid for by the IMT before departure. These include Porter Reservoir, Cabin Dip (at Tom Lee Meadows) and the Cedarville hydrants.
- Remove all flagging, garbage, litter, and equipment.
- No repair work shall commence at known heritage and archeological resource sites without consultation with the archaeologist and lead resource advisor to the fire.

Appendix B

Road Repair to Pre-Fire Status

Road repair should follow the existing design of the road prism. Each road should be evaluated to determine how it should be drained. Some sections only require the outside berm to be broken while others may require rolling dips be installed. Rolling dips are only effective on slopes less than 10%. Steeper sections of road should either be outsloped or drivable water bars installed.

- Clean culverts plugged with soil and rock resulting from road use by fire suppression.
- Remove all slash and debris created by fire suppression from culvert inlets and outlets.
- Clean and grade ditch lines, rolling dips, and lead off ditches to repair function.
- Repair damage to gates, cattle guards, and culverts. Remove soil pushed into cattle guards.
- Grade roads to drain freely. Grade within the existing roadbed. Restore the structure of the road bed by watering, grading, and recompacting.
- Where vegetative material was cut and deposited adjacent to roads it shall be either lopped and scattered to a depth within 18" of the soil surface, chipped, or masticated.
- Do not stack debris in cultural sites.
- Unauthorized routes/roads that were opened for suppression activities will be closed. Rocks, logs, and/or other structures should be placed to disguise the entrance to prevent unauthorized OHV.
- Other suppression repair may include repairs to pavement, culverts, road signs, guard rails, and other facilities directly impacted by suppression activities.

Figure 1 – Diagram of Proper Waterbar Design

NOTE: If width of control/suppression line potentially increases runoff energy, consider using chevrons or alternating the direction of waterbars.

A quick visual guide for waterbar “do’s and don’ts” can be view in the figure below.
