Fire Behavior Forecast # 05

Name of Incident: Delta Fire	Unit: Shasta-Trinity NF, McCloud RD
Date & Time Issued: October 2, 2018 @ 2000	Operational Period: DAY October 02, 2018
FBAN: Steve Ziel	Signed: 

Assumptions: *Damp/wet surface fuels will/has put a damper on any active fire behavior today. Heavy fuels are still very dry, live fuels are "end of season" drought stressed – but the fuels that drive rate of spread and intensity are currently only temporarily out of play until warming and drying occurs.* Expect peak burning conditions 1400-1600. Expect varying low level fire behavior characteristics (**smoldering**) to be present across the fire area – primary activity area will be in the Delta spot fire area on the SW corner of the fire.

Weather Summary

****See attached Fire Weather Forecast ****

Fire Behavior Summary

Fuels in the fire area are primarily composed of:

- Timber Litter:** Timber stands lacking significant understory or heavy concentrations. Will generally produce surface fire effect (underburn) with moderate rates of spread and flame length.
- Timber with Understory:** Timber stands with abundant brush or small trees and fuel concentrations; will burn with higher intensity with frequent torching (with little wind). Heavy fuels and snags contribute to rollout.
- Grass/Shrubs:** Mixed grass/brush patches in open timber stands and on harsh slopes. Fire will spread through brush without significant slope or wind contribution. Grass component spreads rapidly.

Today's fire behavior: *Most areas to show minimal fire behavior today – expect another "non-spread fire day". Primary fire behavior characteristics will likely include pockets of benign smoldering and limited creeping. Very limited surface fire spread may be expected in areas that did not receive sufficient moisture. Heavy fuels (logs, stump holes, snags) and concentrations will continue to hold heat, consume, and produce smoke. Sheltered fuels within tree drip lines will continue to smolder.*

*****Rate of spread (ROS) and Flame length (FL) shown below are based on dry (non-wetted) surface conditions*****

Fine fuel moisture= 8 - 11+%, 1000hr =6%, Live woody fuels 70%, POI = 20-30%.

Fuel Type/Model	Max Head Surface Fire		Spotting Distance	Wet Surface Fuels ROS/FL
	ROS	Flame		
Timber litter (TL8)	2 – 3 ft/min	2 feet	0.2 mile	0 - 0
Timber with Understory (TU5)	5 - 6 ft/min	5 feet	0.2 mile	0 - 0
Grass/Shrub (GS2)	1 – 2 ft/min	1 feet	0.1 mile	0 - 0

Specific Assignments:

Patrol and Repair Groups: Expect continued pockets of widely scattered areas of isolated smoldering, and consumption of heavy fuels. Stump holes, log ends, and snags will hold heat (due to low fuel moisture) until extinguished.

Div. F, P, B: Expect no/minimal fire spread (see graph above) under forecast moist/wet conditions. Expect non-problematic fire behavior due to increased moisture (rain showers), cloudy sky, and cooler temperature.

Air Operations: Monitor cloud ceiling for mountain obscuration. Partly cloudy/scattered showers in afternoon.

Safety

Review Standard Fire Orders.....1. Keep informed on fire weather conditions and forecasts. 2. Know what your fire is doing at all times. 3. Base all actions on current and expected behavior of the fire.

Watch Out when... Weather is becoming cooler and wetter...when wind increases and/or changes direction...when you are getting frequent debris flows across the road, and when terrain and fuels make escape to safety zones difficult.

HYPOTHERMIA

Hypothermia occurs when your core body temperature falls below normal. It can easily happen in cold winds or wetness. Hypothermia can also occur in moderately cool temperatures, particularly if coupled with dehydration. People tend to forget to drink on cool, wet days and can get hypothermic even when the temperature stays well above freezing.

- - Symptoms of hypothermia include
 - Slurred speech
 - Weakness and loss of coordination
 - Confusion
 - Irrational behavior

 - Uncontrollable shivering (although, at extremely low body temperatures, shivering may stop)
 - Pale and cold skin
 - Drowsiness – especially in more severe stages
 - Slowed breathing or heart rate

- Your body automatically begins to shiver to warm itself. As your energy is used up to keep warm, you may reach a point where your body will be unable to warm itself. If left untreated, your body will gradually shut down; and you can die.

- You can avoid hypothermia with the following precautions:
 - Guard against dehydration.
 - Avoid fatigue.
 - Avoid cold winds.
 - Take precautions, change out of wet clothes.
 - Be aware of the symptoms and take action upon their onset.

- If you recognize hypothermia, take the following steps:
 - Move the patient to shelter.
 - Remove wet clothes and replace them with warm, dry garments.
 - If the victim is alert, give them food and warm liquids to drink.

Bear Safety (for you, not the bear)

Sloppy firefighters don't just endanger themselves, but also other firefighters. Bears will return to a site repeatedly if they ate there at some point in the past. When in bear country (where you are now) you should:

Maintain a bear safe campsite

- Store food, drinks and scented items securely.
- Dispose of trash
- Always sleep inside your tent
- Never approach or feed a bear
- Report bear sightings to your Division Supervisor

Take precautions while hiking

- Stay alert at dawn and dusk, when bears are more active
- Make noise as you travel through dense cover
- Stay away from animal carcasses
- Store food, trash and scented items (sunscreen, etc.) in airtight plastic bags

Dispose of trash carefully

- Store trash in a secure location
- Clean the trash container regularly

If you encounter a bear

- **Stand your ground.** Never back up, lie down or play dead. Stay calm and give the bear a chance to leave.
- **Don't run away or climb a tree.** Black bears are excellent climbers and can run up to 35 mph – you cannot out climb or outrun them
- **Know bear behavior.** If a bear stands up, grunts, moans or makes other sounds, it is not being aggressive. These are the way a bear gets a better look or smell and expresses its interest.

If a bear attacks

- **Always fight back.** And never give up! People have successfully defended themselves with almost anything: rocks, sticks, pulaskis, water bottles and even their hands and feet.

Delta-Hirz Fire Suppression Repair

Repair Objectives

- **Minimize Surface and Gully Erosion**
- **Minimize Loss of Soil Productivity due to Erosion In Cleared Areas**
- **Repair Meadows and Wetlands Damaged By Suppression Activities**
- **Minimize Spread of Noxious Weed Infestations**
- **Minimize Excessive Side-Cast Fuels Along Roads**
- **Minimize Impacts to Inventoried Roadless Areas and Wild & Scenic River Corridors**
- **Repair Impacts to Cultural and Historic Resources**
- **Repair Damage to National Forest Roads and Trails Caused by Fire Suppression Activities**
- **Review by Agency READ/REAFs for On-Site Verification of Objectives Completed**

Suppression Repair Focus

- **Dozer Lines**
- **Hand Lines**
- **Roads and Trails**
- **Safety Zones and Staging Areas**
- **Drop Points**
- **Helispots**
- **Water Sources**

Effective Waterbars

When locating and building water bars, place them the right **distance** apart, at a **diagonal** to the fireline, so that they **divert**, then **discharge**, then **dissipate** the energy of the flowing water. Be sure to make them deep enough so they'll be durable, and that soil does **not block** the water bar outlet.

Recommended spacing for waterbars on firelines.

Fireline slope %		Maximum Distance Apart (feet)
1 – 5	200
6 – 20	125
21 – 40	60
41 – 60	40
>60	25

Waterbars should be at least 2 pulaski (4-6 inches) widths wide and 12-24 inches high for handlines.

Waterbars should be no more 2-3 feet tall on dozer lines to enable future access.

Stage 2 Suppression Repair Guidelines

(Apply to National Forest System Lands only on dozer lines with moderate to heavy suppression generated debris)

Applicable Suppression Repair Plan Objectives

- Minimize loss of soil productivity due to potential erosion in cleared areas.
- Minimize surface erosion.
- Minimize excessive side-cast fuels.

General Instructions

- Pile excessive amounts of suppression generated debris.
- Smaller concentrations of suppression generated debris can be feathered back into scraped side slope areas in order to breakdown fuel concentrations and reduce erosion.

Piling Specifications

- Piles should be located at least 10 feet away from tree boles and preferably out of the drip line of the canopy where possible.
- If working in close or closed canopy piles should be built in a configuration that prevents excessive tree scorch (e.g. small piles, windrowed piles).
- If working in large openings on large dozer lines piles can be larger (e.g. 25x25 feet).
- Compress piles as much as possible to improve burn consumption.
- Piles should be clean (free of soil) to ensure adequate consumption during burning and reduced risk of escape in spring.
