ELEVATIONS. A TROUGH APPROACHING THE REGION TOWARD THE END OF THE WEEK SHOULD  
ALLOW TEMPERATURES TO COOL SLIGHTLY AND FOR RH VALUES TO IMPROVE THURSDAY  
NIGHT INTO SATURDAY.

## FIRE BEHAVIOR FORECAST

<b>FORECAST NUMBER: #2</b>	<b>TYPE OF FIRE: Wildfire</b>
<b>FIRE NAME: CORRAL</b>	<b>OPERATIONAL PERIOD: August 15-16, 2013 0600-0600</b>
<b>DATE ISSUED: August 14, 2013</b>	<b>TIME ISSUED: 1800 hrs</b>
<b>UNIT: Six Rivers NF</b>	<b>SIGNED: Richard Gonzales, FBAN</b> 

### INPUTS

#### WEATHER SUMMARY

**Refer to Weather Forecast for details:** Mostly sunny. Max Temp: 80-82°. Min RH: 26-30%.  
Eye Level Winds: Light terrain driven winds becoming West-Southwest 3-5 mph in the afternoon

#### FUELS

Fires are burning within the Megram Fire (1999) and Back Bone Fire (2009). Fuels consist of abundant Heavy Dead and Down, Snags and Shrubs (Ceanothus/Snow Brush).  
Minimum fine fuel moisture: 6%, 1000 hour FMC: 9%, Live fuel moisture: 120%. Persistent drought conditions.

### OUTPUTS - FIRE BEHAVIOR

#### GENERAL:

The primary carrier of the Fires are horizontal stacked logs and branches that have fallen due to previous Fires (Megram 1999 and Back Bone 2009). Fires are slowly creeping through these fuels and consuming shrubs and snags. Snags are producing embers that are contributing to forward progress by spotting ahead.

Expect today's fire behavior to be similar to yesterday. Expect uncontrolled areas of heat along the perimeter. Heat will hold longer in the heavier fuels and in the drainage bottoms.

Corral Fire: continue to creep and back with available fuels. Growth is occurring northerly into the Back Bone Fire scar. Along the eastern flank, the Fire will continue backing towards Horse Linto Creek and establish in the drainage. Watch out for uphill runs on west facing slope as heat builds.

Patterson and Swamp Fires will continue to creep and back with available fuels.

The fire behavior potential will increase in the afternoon as the wind speeds increase. This will be most pronounced on exposed ridges and slopes where the wind alignment occurs.

Maximum Fire Behavior Potential (Head Fire): Rate of Spread: 5 ch/hr. Flame Length: 3-4 ft. Probability of Ignition: 80%. Max spotting distance up to 1/8 mile (observed).

Local Thresholds for active fire behavior: 20' Windspeed > 7 mph; RH < 31%; Temps > 82°; 1000 hr FM < 13; BI > 50; ERC > 47.

Predicted Indices: BI- 59 (down 2) and ERC- 59 (down 1)

**FEEDBACK:** Collect WX obs hourly and turn in to FBAN or IMET at end of shift..include observed fire behavior.

### AIR OPERATIONS

Air support may be limited due to Inversion.

### SAFETY.

When developing strategies and tactics, safety zones and escape routes, you should be evaluating potential fire behavior (worst case scenario), not just observed fire behavior.

## Fire Danger Rating Areas 112/113/115 Energy Release Component

## Fire Danger Rating Areas 112/113/115 Burning Index

- Fire Danger Areas 112/113/115:
- \* 112 - Orleans Ranger District
  - \* 113 - Hoopa Indian Reservation
  - \* 115 - Lower Trinity Ranger District
  - \* NW CA - Region 5
- Weather Stations Used:
- \* 040404 Brush Mountain
  - \* 040408 Hoopa (NFDRS)
  - \* 040519 Underwood (NFDRS)

### Local Thresholds - WATCHOUT:

Combinations of any of these factors can greatly increase fire behavior: 20+ Windspeed over 7 mph; RH less than 31%; Temperature over 82; 1000-hour Fuel Moisture less than 13. Large fires become more frequent when BI exceeds 50 and when ERC exceeds 47.

**Graph Interpretation, Energy Release Component:**  
 Maximum = Highest ERC by day for 1979-2009  
 Average = Shows Peak Fire Season  
 60% = 60th Percentile means 60% of days observed had an ERC below 47.

### PAST EXPERIENCE / LOCAL KNOWLEDGE:

- Wildfires become a problem @ 50 acres on the Six Rivers NF due to topography, fuels, and accessibility. (Large fires=50 acres)
- Large fires become more frequent when 1000 hour fuel moistures drop below 13
- Large fires become more frequent when BI exceeds 50
- Large fires become more frequent when ERC exceeds 47
- High severity, past burn areas with heavy snag / dead and down lead to control problems. (Backbone was a result of this, as it started in the Megram fire area of 99)
- \* Afternoon winds in the Trinity River Drainage greatly influence fire behavior.
- \* Coastal fog observed from the Trinity Valley is a good indicator of strong down canyon winds in side drainages west of the river.
- \* Klamath River Canyon has very strong up-river winds daily, from the border near Weitchpec to the confluence with the Salmon River. Expect strong winds in the afternoon until sundown. Potential thermal belt up to approx. 2000'.

**Graph Interpretation, Burning Index:**  
 Maximum = Highest BI by day for 1979-2009  
 Average = Shows Peak Fire Season  
 63% = 63rd Percentile means 63% of all days observed had a BI below 50.

## Medical Evacuation of Personnel from Corral Complex

This fire is burning in very remote, steep and rugged terrain where access is difficult. Southern California Incident Management Team 2 is committed to providing the necessary response should any medical incident occur and to ensure that a rapid and appropriate evacuation is completed. This plan is designed to identify and outline the steps necessary to safely and effectively evacuate an injured firefighter from the Corral Complex and deliver that firefighter to an appropriate medical facility in both daytime and nighttime settings.

Once notification of a medical emergency, and the Division Supervisor and/or EMT's make the decision that a medical evacuation is required, Incident Management Team components will work together to accomplish the evacuation. Medical Unit Leader, Safety Officer, and Air Operations will join the Communications Unit in the communications trailer for a coordinated response. The highest qualified medical personnel on scene shall assume control of patient care. The Division Supervisor shall coordinate the response, and handle communications with incident communication unit and medical unit, and air to ground communications. The Division Supervisor may delegate communications to appropriate resources as needed to facilitate the operation.

### Ground Medical Evacuation

- If the injured firefighter is *WITHIN* reasonable hiking distance from a road which can be driven and determined to have a condition which *WILL NOT* be aggravated by driving him/her out, then an incident vehicle shall be utilized to evacuate the injured firefighter from the scene to either the ICP Medical Unit or to a rendezvous point with a ground ambulance. The destination decision shall lie with the DIVS with consultation from the highest level care provider on scene.
  
- The following ground ambulance providers and locations for ground ambulance coverage for this incident location:

Agency	Base Location	Provider Level	Drive Time to ICP
Hoopa Ambulance	Willow Creek, CA	Paramedic	5 minutes
Hoopa Ambulance	Hoopa, CA	Paramedic	30 minutes

**Air Medical Evacuation**

- If the injured firefighter is *NOT WITHIN* reasonable hiking distance to a road and/or determined to have a condition which *WILL* be aggravated and worsened by driving him/her out, the following aircraft shall be launched based on the closest available resource needed to meet the injured firefighter at the helispot or hoist site. # **Snag & Contour**

## **Felling Safety Message**

**Size-up hazards in the work area.  
Never become complacent.  
Always look up.  
Get wind/weather report.**

### **Corral Complex – August 15th**

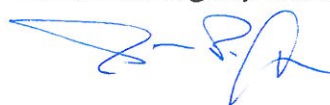

**Snag and contour felling considerations include:**

- 1) Use saw teams and Falling Bosses.**
- 2) Post lookouts concentrating on snags.**
- 3) All sawyers assure themselves a quick and safe escape route from the tree they are falling.**
- 4) Do not turn your back on a falling snag.**
- 5) Snag fire access routes as necessary – roads, trails, and drop points.**
- 6) Keep crews spread out – Don't bunch up.**
- 7) Two sets of eyes are better than one.**
- 8) Heads up for erratic winds from storm cells.**
- 9) Stay well clear of all air operations including cargo drops, water drops, slurry drops, low level flights, arrivals and departures at helispots, etc.**
- 10) Consider the domino effect when determining safe distances from hazard snags.**
- 11) If a crew doesn't have a qualified saw with them to mitigate hazard snags, they should just stay entirely clear from identified hazard snags.**
- 12) Consider green trees as hazards also – burned out stems or root systems pose a serious safety hazard.**
- 13) Watch for burned out root systems on snags and green trees as well, especially several days into the incident – a sound snag or tree today may not be tomorrow.**

**LOOK UP - LOOK DOWN -LOOK ALL AROUND**

**THE VERY WORST FIRE PLAN IS NO FIRE PLAN**
