OUTPUTS

FIRE BEHAVIOR

GENERAL: With continued warm and dry conditions expect another day of active fire. Most of the perimeter remains in backing and flanking alignment. There are limited areas including some near the new fire (Smoky=Div. Q) that may have wind and terrain alignment. As the smoke inversion lifts out in late afternoon, and you start to see majority blue skies, expect an increase in fire activity. Short duration intense head fire runs are possible as the main fire backs into drainage bottoms and slope reversals create wind/slope alignment. Fire whirls are probable at intersecting drainages and when the winds transition from upslope to downslope. Make sure lookouts have a good view of the fire, especially since the smoke will limit visibility.

With these dry fuels, spotting will be problematic and should be short range (100-300ft) for the most part and from rollout. Spots from several torching trees on a ridgetop can spot 0.3 miles. The Probability of Ignition is 80-90%

Expect single and group tree torching and sustained short duration crown runs where slope and winds align.

At night, expect the fire to remain active until about 0300 to 0400 hrs with fair to poor RH recovery.

SPECIFIC:

Branch I: Minimal forward fire progression. Rollout will challenge containment lines. There are multiple green islands near the line, if they begin to actively burn expect spot fires over established lines. Much of the branch did not burn cleanly so there is a possibility of reburn where shrubs were scorched but not consumed along the fire's edge.

Branch V: Minimal to moderate forward fire progression is expected (8-15 ch/hr with 5-9 feet of flame length in timber litter with understory). Watch for slope reversals as the fire reaches drainage bottoms. As the wind transitions at night, the potential for head fire runs will increase. Expect islands near the line to burn out and there is a potential for reburn; either of which will challenge existing lines.

Branch X: Main fire progression will be towards Scott Bar and down the Hwy 96 corridor. Rollout will continue to be problematic and challenge any established lines. If skies clear and a plume develops, spotting distances will increase, and the river and highway may be challenged. There was little to no rain this past week on this branch. Clouds and smoke will continue to moderate fire behavior. (8-15 ch/hr with 5-9 feet of flame length in timber litter with understory).

Branch XX: Expect fire progression to the NE. North of the river there is a combination of grass fuels and heavy dead and down component from the 2014 Beaver Fire that will make the fire more resistant to control. Watch for various slope and wind alignment on the Smoky Fire (Div Q).

IA: With the state of the fuels, expect any new start to be resistant to control. For fire aligned with slope and wind, expect rapid rates of spread with the potential for crown runs where dense canopies are present.

AIR OPERATIONS: Smoke will limit air operations or until the inversion mixes out about 1500.

SAFETY

Make sure Lookouts are posted in places where they can see fuels and fire below crews, even in smoky conditions. Fuels, both large and small, are critically dry and will respond rapidly to direct sunlight.

SAFETY MESSAGE

Dehydration:

Dehydration is a real threat with the current and expected warmer and drier weather and can limit your body's ability to avoid heat related illnesses. Start drinking water before you become thirsty: start drinking water at the beginning of the shift and throughout the day or night. If you are thirsty, you are showing signs of dehydration. Avoid drinking caffeine drinks as they can lead to dehydration.

MAJOR HAZARDS AND RISKS

STEEP TERRAIN FATIGUE DRIVING	ROLLING MATERIAL DEHYDRATION EXCESSIVE HEAT	HEAVY EQUIPMENT HAZARD TREES COMPLACENCY
-------------------------------------	---	--

Be sure all elements of your safety plan are in place prior to engagement

Symptoms & Signs of Heat Illness

Heat Exhaustion: Victim will have cool, clammy skin; pale coloring; feel weak, dizzy and/or nauseous.

Treatment – Have individual sit in shade or cool area; administer fluids; loosen clothing and assure rest.

Heat Stroke: This is a life-threatening medical emergency!!

Victim will have hot, dry, red skin and possible convulsions. These symptoms can progress to unconsciousness and death!

Treatment – Initiate emergency medical procedures outlined in incident Med Plan. Immediately cool individual's body by pouring water over them, especially the head and upper body. Monitor the victim and provide whatever medical support necessary. Placing ice around the neck, groin and armpits can help speed the cool down.

Night Operations Hazards

Your ability to maintain your situational awareness at night is compromised by your inability to see hazards and other visual indicators in your work area.

Other challenges faced during night operations:

- Ability to maintain your orientation
- Difficulty seeing hazards beyond your headlamp
- Difficulty estimating distances
- Inability to use landmarks as reference
- Fatigue and complacency
- Logistical support is limited

RE: McKINNEY Incident Fire Suppression Repair

Fire Suppression Repair with the State Direct Protection Area will occur on dozer lines, handlines roads, and other areas utilized by fire suppression resources. The purpose of the repair is to mitigate possible adverse effects to resources resulting from fire suppression activities.

Dozerlines

Approximately 75% of the fire perimeter and contingency line is dozerline. Dozerline constructed on this incident varies between single blade width to five blade widths (approximately 12-50 feet). The following measures shall be implemented for constructed dozerline:

- 1) Berms and push-piles shall be spread to the extent feasible. This is generally accomplished by back-blading with a tractor or with an excavator. Debris piled against standing timber shall be pulled back while taking care not to damage growing stock with the tractor blade or an excavator bucket and thumb. At helispots/staging areas and safety zones, remove soil, and/or breach berms so that runoff can be dissipated. Cross drain these areas to effectively dissipate water if necessary.
- 2) Waterbreaks shall be installed at a spacing which corresponds to a moderate erosion hazard rating in the California Forest Practice Rules. Maximum spacing shall be as follows:

<u>Line Gradient</u>	<u>Maximum Waterbreak Spacing</u>
0-10%	200 Feet
11-25%	150 Feet
26-50%	100 Feet
>50%	75 Feet

NOTE: The preceding waterbreak spacing information is a general guide for maximum spacing, actual location of waterbreaks should be tailored to the topography and placement should be suited to the best dispersal of water flow.

- 3) Waterbreaks shall be constructed at an approximately 45 degree angle and shall be a minimum depth of 10 inches from the bottom of the cut to the top of the berm. Where possible

the discharge from the waterbreaks shall be directed into vegetated areas to minimize erosive forces.

Where slopes exceed the range at which a tractor can effectively work, waterbreaks shall be constructed with handtools.

Where dozerline has crossed watercourses, the channel of the watercourse will be cleared of soil and debris to re-establish the watercourse channel.

Hand Constructed Fireline

- 1) Hand constructed fireline shall have water breaks installed with hand tools. The waterbreaks shall be approximately 10 inches in depth from the bottom of the cut area to the top of the berm. Waterbreaks shall be angled at least 45 degrees to the fireline. The interval between waterbreaks shall be approximately 50 feet with closer spacing as needed on steep pitches. No waterbreaks shall be required where the fireline traverses a side hill, however if the line is cup trenched the berm shall be breeched periodically to prevent channelization of runoff.
- 2) Where hand constructed fireline crosses a watercourse, any soil material deposited in the channel shall be removed and placed in a location where it will not wash back into the watercourse. Waterbreaks shall be installed on the approaches to the crossing to prevent sediment from eroding from the fireline into the watercourse.

Fire Roads

- 1) Roads used in fire suppression activities shall be left in at least as good a condition as they were found. Gravel and soil surface roads shall be watered to prevent excessive dust formation. Where suppression activities have damaged or rendered road drainage facilities non-functional, waterbreaks or drivable drainage dips shall be installed for drainage.
- 2) Where suppression activities have filled in or damaged inside ditches, the ditches shall be cleaned and left unobstructed.

Archaeological Resources

If any sites are located during suppression repair activities, work will stop in that location and the Suppression Repair Lead will be notified.

If you have any questions, please contact Forester I, Peter Feller at 530-841-3219.

6 Seconds

6 seconds, the amount of time it generally takes for one to sneeze (depending on the sneezer), for normally outstanding employees (fire personnel) to “let their guard down” and say or do something that has a negative effect on their time here on the incident.

After being on an incident for a few days, a week, or whatever amount of time it takes, we begin to become more relaxed with those who we work close with. When we become more relaxed with our communication because we feel we’re “tight” with someone or our crew and they are “cool,” we may feel it’s okay to tell a dirty joke or make a comment about how a coworker looks or (insert any other inappropriate comments not safe for work (NSFW)). However, when we say or do something NSFW, we open ourselves up to a complaint being filed, and possibly as a result, being released from the incident and our employer being notified. It’s never a good thing when that happens.

Let’s guard our words and actions and remember we all need to communicate in a respectful and professional manner.
