Discussion:

Only very isolated showers remain possible early today before a shift toward drier conditions. Highs today will remain below normal but will be a few degrees warmer than Friday. The primary forecast focus today and tomorrow will center on increasing winds beginning this afternoon. Strong wind gusts in excess of 30 mph are expected after 1200 over the ridges and exposed areas. These strong winds will continue through the overnight with the potential for wind gusts exceeding 40 mph at times. Winds will diminish a bit on Sunday but still remain breezy with gusts of 25 to 30 mph expected over the ridges and exposed areas.

TODAY:

Sky/Weather: Mostly cloudy early with showers ending by mid-day. Sky will begin to clear by mid-afternoon. Gusty winds possible during the afternoon and evening.

Max Temperature: Valleys: 68 to 73. **Mid-Slopes and Ridges:** 50 to 59.

Min RH: Valleys: 35 to 45 percent. **Mid-Slopes and Ridges:** 45 to 55 percent.

Fire Behavior (for new starts or unburned areas)

FIRE BEHAVIOR

GENERAL:

- Decreased fire activity throughout the fire area, except a few areas of isolated heat. Where heat is holding over, such as stump holes, boles of trees, sheltered litter/duff, or heavier fuel loads of dead/down logs.
- Nighttime relative humidity (Rh) recoveries have and will continue to increase fuel moisture values over the next few days. This will reduce availability of fine dead fuels, such as dry grass, conifer needles, and leaf litter from being readily available to carry fire except during the late afternoons during the burn period when the lowest fuel moistures follow a parallel nighttime high/daytime low pattern with the relative humidity.

SPECIFIC:

Branch X: Minimal fire activity most of the division. IR flight from night 9/27-28 showed significant number of isolated heat signatures dispersed over north-half Peach fire. But no intense or scattered for majority of area. Monitor for fire/heat creeping through duff and heavy fuels near control features, and effect of winds in the afternoon on known pockets of heat in heavier fuels for potential threats to the line.

Branch XX: Minimal fire activity throughout fire area, except for numerous isolated heat signatures in what could be considered the original footprint(s) of the Bluff #1, Blue Creek 2, Copper, Marlow, and very northern portion of Mosquito, near the GO Road (in general are of DP 22). Activity should pick up earliest in areas where alignment of solar heating (sunlight), south aspect, and exposure to wind (accelerates drying).

AIR OPERATIONS:

Cloudy in the morning, but skies clearing in the afternoon will improve air operations.
Sunrise: 7:10am, Sunset: 6:58pm, Daylength: 11 hours, 48 minutes, 14 seconds (-2:41min)

SAFETY:

Rolling material loosened by fire activity burning out the supporting structure is still a threat when working on fire perimeter, or along roadway. Stay vigilant and remain focused on the task at hand.
