

Notes on TITUS FIRE Infrared Flight
09/09/06 Approximately 21:56
Flight by plane N144Z Citation
Happy Camp Complex: Titus Fire
There were no problems associated with the interpretation of this Thermal IR. The imagery was very clear and lined up really well with base map layers.
Heat perimeter growth since the last IR flight has been primarily in the southeast section of the fire and heat intensity is highest in this section as well.
These two shapefiles are projected in UTM in NAD83.
