

Notes on Pigeon FIRE Infrared Flight
09/10/06 Approximately 19:00
Flight by plane N702 Piper
Bar Complex, Pigeon Fire:
There were two large heat sources found outside the heat perimeter from the last operational period. These sources were digitized and added to the perimeter shapefile. As with all other IR imagery received, there are phase shift errors that cause the images to not overlay properly. This results in a judgement call as to where the exact location of heat sources occur.
