

Notes on Hancock FIRE Infrared Flight
09/10/06 Approximately 23:00
Flight by plane N702 Piper

UNCLES Complex, Hancock Fire:

There is very little heat growth on this fire but the main area of heat outside of yesterday's perimeter is located in the southwest section of the fire along Steamer Creek. There is a phase shift error associated with the IR imagery which makes it impossible to overlay properly on the background image. This error suggests that the fire has crossed Steamer Creek. I do not believe that this has happened and I placed the heat line along the creek boundary.
