OUTPUTS

FIRE BEHAVIOR

GENERAL:

Most of the current fire perimeter lies within the 2017 Garza fire footprint. The fire area is dominated at lower elevations by cured, grazed annual grasses and live shrubs, transitioning to patchy brush and grass-oak woodland intermixed with gray pines in the upper elevations. Cured grass loading increases significantly with elevation.

Fire danger indices (ERC, BI, SC) at the Alcalde RAWs have fallen below their seasonal averages for the period of record and continue to trend downward. Fine fuels will respond quickly to the changing weather conditions, but larger size classes remain dry and available. Absent a wetting rain, maximum probability of ignition during peak midafternoon burning conditions will be 50-70%.

SPECIFIC:

DIVS A / F / K / L: No further movement is anticipated. Expect isolated heat and smokes interior. Any heavy fuels still smoldering in these areas have been burning for nearly a week; be alert for stump holes, ash pits, and fire-weakened trees.

DIVS O / S: The fire has reached control features on both divisions. Heavy fuels interior will continue to smolder and consume; flare-ups remain possible in remaining islands of unburned brush within the perimeter. Watch for burning snags close to control lines.

DIVS W / Y: Rollout potential remains in areas of recent fire activity above steep slopes. Any remaining pockets of unburned fuel adjacent to control features will present a threat until secured, although this risk continues to diminish as weather cools and moistens.

AIR OPERATIONS:

No impacts to air operations anticipated. Mixing height 5000' AGL.

Sunset: 7:17 P.M.

Sunrise: 6:39 A.M.

SAFETY

Extended burnout times in areas of heavy fuels can weaken and bring down trees and branches. Remember to LOOK UP before committing to a work area or break area, and communicate any hazards to others!
