<b>Comments /notes on tonight's mission and this interpretation:</b> *Interpreted acreage was not reported here or on the IR maps at the request of the incident SITL. Tonight's mapping began with an incident provided perimeter. The main area of heat perimeter growth was mapped in the northwest portion of the fire, south of the 33E22 trail. This area also displayed a small pocket of intense heat. A fairly large unburned interior island remains to the east of the mapped intense heat. Pockets of scattered heat were also mapped along the ridge line between Lookout Mountain and Schaeffer Mountain. Isolated heat sources were mapped throughout the fire area, especially in the southern and western portions of the fire area.
