<b>Comments /notes on tonight's mission and this interpretation:</b> *At the request of the incident, acreage is not reported. Tonight's mapping used last night's heat perimeter as a starting point, and no perimeter growth occurred. Some interior intense heat was mapped in the northwest portion of the fire, along with scattered heat sources. The northeast side of the ridgeline between Schaeffer Mountain and Lookout Mountain continues to display scattered heat. Numerous isolated heat sources were again found throughout the fire area, with the highest concentrations in the northwest corner of the fire and along the southwestern portion of the fire.
