| <b>Comments / notes on tonight's mission and this interpretation:</b><br>Tonight's mapping began with the previous night's IR heat perimeter.<br>No perimeter change was detected in tonight's imagery.<br>Two small polygons of intense heat were mapped tonight, both on the north side of the unnamed drainage south of Red Mountain Creek. A few pockets of scattered heat also persist in this same area along with multiple isolated heat sources. Multiple isolated heat sources, and one polygon of scattered heat were mapped in the area of Stecker Flat and the unnamed bench southwest of Stecker Flat.<br>One pocket of scattered heat remains on the north facing slope above Taboose Creek.<br>Isolated heat was once again found in the upper Taboose Creek drainage, and in the Shingle Mill Bench. A pocket of scattered heat remains on the west end of Shingle mill bench.<br>Two isolated heat sources were once again mapped on the fire's eastern perimeter approximately 1/10 mile northwest of the Shingle Mill Bench Sling Site.<br>Note: An isolated heat source was detected approximately two miles northeast of the fire perimeter at the Tinemaha Campground, most likely a campfire (118° 16.164' W, 37° 3.107' N). |   |   |  |
