# FIRE BEHAVIOR FORECAST

FORECAST NUMBER: 01	TYPE OF FIRE: Wildfire
FIRE NAME: Alisal	OPERATIONAL PERIOD: October 12, 2021 – 24hr
DATE ISSUED: 10/11/21	TIME ISSUED: 2200
UNIT: CA-LPF	SIGNED: <i>Isl Patrick Doyle</i>

**WEATHER SUMMARY:** \*\* See Spot Weather Forecast \*\*

Northeast winds this morning switching to westerly winds in the afternoon, then switching back again to Northeast in the evening as weaker northeast sundowner winds will begin. Humidity will increase to +40% into the evening, but the potential for a return of strong down sloping winds for the next several evenings will continue to be of concern.

## FUELS SUMMARY:

Dense chaparral shrubs that haven't burned since the 1955 Refugio Fire on the upper northern slopes. Grass and agriculture lands in the southern foothills. The 2004 Gaviota Fire is just west of the Alisal Fire and the 2016 Sherpa Fire is approximately 3-miles to the east, just east of Refugio Road.

## FIRE BEHAVIOR

### GENERAL:

- Wind being the primary driver over fuels for fire growth, fire spread will be to the east-southeast, continuing to look for opportunities to push through the 2016 Sherpa fire footprint. Actively flanking to the West, and backing to the North, with mid-day Westerly winds pushing the fire east and then south as the weak Sundowners set in.
- Live fuel moistures from the Refugio sampling site are around 50%, well below critical levels
- Expect rapid rates of spread with gusty winds but less than the night before. Long distance spotting (0.1 to 0.5 mile), to the east during the day switching to downhill when the sundowner winds surface.
- Watch out for multiple wind-switches today. NE to W back to NE (morning-day-evening) with more diurnal influence today.

### SPECIFIC:

**DIV B & C:** West-winds and low live fuel moistures will push fire through areas unlined and test areas that have been lined. Key area to watch for wind switches today and fuel stringers that will provide fire opportunities.

**DIV A, Z & Y:** Active backing, flanking fire through area with direct solar heating and winds. Expect with lower windspeed then yesterday, fire will be backing-flanking more actively especially in chaparral, midslope-to-ridgetop.

### AIR OPERATIONS:

Aircraft should be able to support ground resources for most of the day. Winds may impede operations during the early morning or later evening hours when the winds are strongest.

Sunrise: 0703am Sunset: 1825pm Length of Day: 11 hrs. 21 min. (losing 2 minutes of daylight each day)

## SAFETY

Don't be "unfamiliar with weather and local factors influencing fire behavior." Understanding what the weather forecast is how that will influence fire behavior in a specific area is every firefighter's responsibility.

## SAFETY MESSAGE

*Fire fighter safety comes first on every fire, every time*

### TRANSITION occurs today.

- ✓ Take your time. Use two-way communication to address any areas that are not clear.
- ✓ Get to know the new leadership, ask questions if you're not clear on instructions so you know the task and hazards prior to engaging in operations.
- ✓ Make sure that **everyone** knows what your leadership wants you to do.
- ✓ Ensure instructions are clear and understood prior to engaging in any fire operations.
- ✓ Briefings should be clear, objectives stated, and leader's intent expressed.
- ✓ Transitions are a common denominator in tragedy fire. This is preventable.
- ✓ Very often a transition is not an easy process. Have patience with yourself and others.

### **Micro-Climates:**

Microclimates are areas that have a different climate from the space around them, and there are many reasons why they occur. Micro-climates can frequently be warmer and drier due to aspect and slope. In the wildfire environment these can contribute to rapid rates of spread. Locally, as gullies, chutes, chimneys, and canyons receive hot dry air from the seasonal winds, rapid drying of 1-hr and 10hr fuels will occur. If fire is present, growth can be robust and very unpredictable.

Fuels can be of a different type than surrounding area and more concentrated. Sun angle will change throughout the day pre-heat the fuels. If the understory has been burned off, the remaining fuels are positively pre-heated and far more receptive to ignition at lower temperature burning more potently. Avoid these areas if possible.

### **Safety Officer: What to Expect.**

- We are here to help everyone on the fire.
- We don't do OPS; we do offer ideas and recommendations.
- We sign the Medical plan, support the medics and work with OPS to position EMT's where needed.
- When we bring up safety issues it's because we care and want a safe operation.
- We compile information after accidents and facilitate learning.
- We assess and mitigate risk allowing operations to proceed more safely.
- We are not PPE cops, that's your job.

<b>Kody Kerwin, COML (925) 953-3044 Communications: 480-640-0402</b> The convention calls for frequency lists to show four digits after the decimal place (five digits for 700 MHz frequencies). The letter "U", "N", or "W" in the deviation (Dev) column reflects whether the frequency is ultranarrow (6.25 kHz), narrow (12.5 kHz) or wide band (25 kHz). Mode refers to either "A" indicating Analog, "D" indicating Digital (e.g. Project 25) or "M" indicating Mixed Mode. All channels are shown as if programmed in a control station, mobile or portable radio. Repeaters (and depending on use, base stations) must be programmed with the Rx and Tx reversed.
