FIRE BEHAVIOR

GENERAL

Warm temperatures and low relative humidity, coupled with strong afternoon winds, may result in moderate to extreme fire spread. Fireline intensity may preclude direct attack opportunities.

The primary carrier on the Loyalton Fire is the grass and shrub fuels. On the southern portion of the fire fuels change to more patchy stands of timber intermixed with open areas of brush and grass.

Smoke impacting the fire area may reduce fire behavior on the incident.

Unlikely fire will breach current containment lines.

SPECIFIC FIRE BEHAVIOR

Grass/shrub fuels outside containment lines: Potential rate of spread 40-60 chains per hour with 8-10' flame lengths. Spotting distance to 2/10 mile.

Mixed timber fuel with litter and understory (Divisions R/Z): Fuel model 10 shows rate of spread 15-20 chains per hour with flame length 6-8 feet. This fire behavior will likely lead to torching. Stands that have continuous canopy could see short-duration crown fire runs with the predicted winds. Maximum spotting distance ½ mile. Rollout of larger fuels may establish as spot fires south of containment lines in Romeo/Zulu.

Probability of ignition 80-90%.

AIR OPERATIONS

Air operations could be impacted by smoke throughout the shift.

Sunrise: 08/22 06:20

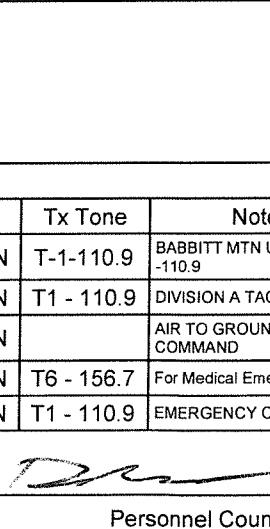

Sunset: 08/22 19:46

SAFETY

Ensure all personnel on the fire are briefed on weather and potential fire behavior conditions for the day. Although the fire is nearly fully contained there is still a possibility of interior islands burning out and spots occurring over the line.

Loyalton Fire Suppression Repair Plan

Repair Specifications

The following guidelines are to be applied when implementing fire suppression repair on the incident.

OBJECTIVES

Minimize surface and gully erosion.

- Minimize sediment delivery to stream channels.
- Restore conditions to pre-fire drainage patterns.

GENERAL GUIDELINES

Hand and Dozer Lines

- Install and construct water bars on firelines according to the following guidelines. (See diagram below)

Fireline Slope	Maximum
1-6%	300
7-9%	200
10-14%	150
15-20%	90
21-40%	50
41-60%	25

Note: Modify spacing to take best advantage of rocks, brush clumps and natural drainage as discharge outlets and to avoid unstable terrain.

- At the beginning and terminus of dozer lines, construct barriers with native logs where they exist to discourage post-fire vehicular traffic.
- Water bar and remove berms. See above for spacing guidelines.
- Pick up and remove all garbage, flagging, litter and unneeded equipment.
- Breach trenches approximately every 100 feet in logical locations such as dips in the line.
- The water-bar should be no more than two (2) feet in total height from the bottom of the dip to the top of the water-bar.
- Where lines cross drainages, loose soil and woody debris should be removed 15 feet on both sides to restore the channel and to ensure that the material will not roll back into the channel.
- Prevent fire lines and trails from becoming unauthorized OHV motorized routes.
- ****Encourage MIST techniques to rehab fire operations in RNAs****

Trail and Road Repair

- All system roads identified for rehabilitation will be graded after suppression and repair activities are concluded.
- Re-establish and repair suppression-damaged drainage structures to pre-fire conditions.
- Channel and system trail crossings created during suppression operations will be returned to pre-fire conditions.
- Remove new fill material and restore disturbed channels to their natural shape.
- Where lines cross hiking trails, remove suppression debris, rocks, brush and re-establish trail subgrade and tread.

Camps and Drop Points

- Remove all flagging, garbage, litter and unneeded equipment.
- As much as practical, restore sites to pre-fire conditions. Comply with all conditions of any Land Use Agreements
