Comments /notes on tonight's mission and this interpretation: Very slight growth in the heat perimeter from last IR. Most is due to minor adjustments to include heat sources detected along the perimeter. Several heat sources were detected outside the eastern perimeter. Two hot spots contained intense heat. Two heat sources were detected outside the perimeter along the North Fork Kennally Creek. Majority of the isolated heat detected within the perimeter was in the South Fork Buckhorn Creek drainage and on the ridge to the east of this drainage.
