Comments /notes on tonight's mission and this interpretation: Growth in the heat perimeter from last IR is primarily on the eastern perimeter, into the headwaters of Little Buckhorn Creek. Areas of intense and scattered heat were detected in the Little Buckhorn Creek drainage. Two heat sources were detected outside the heat perimeter and are labeled on map. Majority of the isolated heat detected within the perimeter was in the South Fork Buckhorn Creek drainage and on the ridge to the east of this drainage.
