<b>Comments /notes on tonight's mission and this interpretation:</b> Growth in the heat perimeter from last IR is primarily on the eastern perimeter, into the headwaters of Little Buckhorn Creek and the ridge west of Cougar Creek. Areas of intense and scattered heat were detected in the headwaters of Little Buckhorn Creek and along the ridge west of Cougar Creek. Three heat sources were detected outside the heat perimeter along North Fork Kennally Creek and are labeled on map. Multiple heat sources outside of the perimeter were detected in the headwaters of Little Buckhorn Creek and on the ridge west of Cougar Creek. Majority of the isolated heat detected within the perimeter was in the South Fork Buckhorn Creek drainage and on the ridge to the east of this drainage.
