<b>Comments /notes on tonight's mission and this interpretation:</b> Used perimeter found on the NIFS on 8/6/2020 at 2000 as a starting point for tonight's interpretation.  Lots of intense heat on this first IR flight. The heat perimeter has split into two separate heads. The eastern prong is up to the road just south of Stockade Spring. The heat has mostly held at the south side of the road, but as of flight time, there was an isolated heat source to the north of the road. That prong of the heat perimeter was to about the center of section 10, while the western prong was nearing the center of section 9.  Three versions of the map have been uploaded – with three different backgrounds.  Questions, comments, please contact the IR interpreter via the contact info above.
