

Monitoring is the orderly collection, analysis, and interpretation of environmental data to evaluate management's progress toward meeting objectives, and to identify changes in natural systems particularly with regards to fuels, topography, weather, fire behavior, fire effects, smoke, and fire location. This may be done onsite, from a nearby or distant vantage point in person, for example, the work done by Fire Effects Monitor (FEMO) or Field Observer (FOBS) positions or by using a sensor, or through remote sensing (aircraft or satellite).

Confine A wildfire response strategy of restricting a wildfire to a defined area, primarily using natural barriers that are expected to restrict the spread of the wildfire under the prevailing and forecasted weather conditions. Some response action may be required to augment or connect natural barriers (e.g. line construction, burn-out, bucket drops, etc.).

Point or Zone Protection A wildfire response strategy which protects specific assets or highly valued resources from the wildfire without directly halting the continued spread of the wildfire.

Full Suppression implies a strategy to "put the fire out," as efficiently and effectively as possible, while providing for firefighter and public safety. To complete a fireline around a fire to halt fire spread and cool down all hot spots that are immediate threat to control line or outside the perimeter, until the lines can be reasonably expected to hold under foreseeable conditions. Full Suppression is synonymous with "Full Perimeter Containment" and "Control".
