.DISCUSSION...

Moisture will continue to increase through the weekend, and enough moisture will be in place by Sunday to promote the development of numerous showers and scattered thunderstorms. The greatest amount of uncertainty revolves around the amount of cloud cover. A scenario with lots of cloud cover will keep temperatures lower, and reduce the amount that the atmosphere is able to become unstable, thus lowering the risk for heavy rainfall. In this scenario, showers are favored over stronger, organized thunderstorms. However, more sunshine in the morning and early afternoon hours will lead to an environment that more strongly favors organized shower and thunderstorm activity with a higher potential for localized heavy rainfall. Given the anticipated spotty nature of shower and thunderstorm activity, rainfall amounts will vary greatly over short distances. Therefore, rainfall amounts could range from only a trace or few hundredths of an inch up to 0.25" of rain on the high end.

.SUNDAY...

Sky/weather.....Mostly cloudy (70-80 percent cloud cover). Numerous showers with isolated thunderstorms in the morning and scattered thunderstorms in the afternoon.

Transport winds.....Southeast around 7 mph becoming west around 8 mph in the afternoon.

.SUNDAY NIGHT...
