Comments / notes on tonight's mission and this interpretation: <ul style="list-style-type: none"> • Started interpretation with incident provided perimeter based on data downloaded from Internal View Services (National Incident Feature Service 2022) on 8/16/2022 @ 2004. • No change in perimeter acreage, still at 21,349. • A few patches of intense heat the top middle part of the fire next to the shore of Lake Mary Rowan. • Small patches of scattered heat. • Lots of isolated heat sources. Highest density is in the northern middle area and in the interior on the west side. • The provided geodatabase and shapefiles are in WGS84 decimal degrees, so would be convenient for working in IES and IVS. • Maps are in NAD83 UTM 11. • Feedback is always appreciated. Please contact the interpreter at the contact information listed above.
