Comments / notes on tonight's mission and this interpretation: <ul style="list-style-type: none"> • Started interpretation with incident wildfire daily perimeter downloaded on 8/26/2022 @ 1811 MDT from NIFS (National Incident Feature Service 2022). • No change in heat perimeter acres. Continues to be 6,724. • No intense heat was mapped. • Size of the scattered heat polygons are shrinking. Majority of patches are in the northeast area. • Isolated heats are scattered throughout the middle area, with a more dense number in the northeast. • The provided geodatabase and shapefiles are in in WGS84 decimal degrees, so would be convenient for working in IES and IVS. • Maps are in NAD83 UTM 11. • Feedback is always appreciated. Please contact the interpreter at the contact information listed above.
