Comments /notes on tonight's mission and this interpretation: Started interpretation from 08/29/2018 IR heat perimeter. Most of the growth was interior islands burning to reduce their size or eliminate them all together. Most activity was around the outer edge of the fire. Just a few isolated heat sources in the center interior of the fire. On the following maps the yellow is the 08/27 infra-red heat perimeter and the red line is the current infra-red heat perimeter. This is an example of interior islands with heat to add to the growth acres of the fire:
