<b>Comments / notes on tonight's mission and this interpretation:</b> I began interpretation by combining yesterday's IR perimeter and the most recent wildfire perimeter. Orthorectification of the scanned images was good and no georeferencing on my part was necessary. Most new acres were accounted for by the fact that the wildfire perimeter was larger than the IR perimeter. The heat within the perimeter is cooling off, though there are still few areas that are devoid of heat, there is less intense heat, and the scattered heat is thinning out.
