Comments /notes on tonight's mission and this interpretation: Began with NIFS IR heat perimeter from 10/19/2022. Very minimal heat perimeter growth. Small increases were made on the northern perimeter at Canyon Creek, where it has crossed to the north side of the creek bottom and is moving up the ridge on the north side of the drainage. Intense heat is associated with this growth. There was a small increase at the headwaters of Ninemile creek, north. A small excursion again in the White River bottom, south of river mile 5. Areas of intense, scattered, and isolated heat have continued to dissipate compared to the previous flight. There are no new isolated heat sources outside of the heat perimeter.
