Comments /notes on tonight's mission and this interpretation: Started interpretation with the NIFS perimeter from 10/19/2022. Continued intense heat and heat perimeter expansion on the southern and southeastern flank, expanding southwest downslope into the headwaters of Gate Creek. A long arm of heat perimeter has moved east up the ridge and is still spotting to the east along the ridgetop in the headwaters of Grouse Creek. remainder of the perimeter saw slight expansion, and the interior has cooled significantly overall, except for the south and southwest flank. Some modest growth on the north slope of Chikamin Ridge, backing downslope toward Chikamin Creek. Interior heat signatures have cooled, showing less scattered and isolated heat.
