| Comments / notes on tonight's mission and this interpretation: I began interpretation with the previous IR perimeter since I didn't see any differences between it and the NIFS wildfire perimeter. I mainly used the black and white image to do my interpretation since heat sources appeared more distinct on it than on the color image, possibly because the heat has cooled to a low level and is providing a weak IR signal. There was no intense heat to be seen, and very little scattered heat. I have been having some issues with the IR data showing as updated after syncing to the NIFS. It shows as updated in the IR edit data, but isn't updating in the Internal View Service. | | | |
