Comments / notes on tonight's mission and this interpretation: I began interpretation with the previous IR perimeter since I didn't see any differences between it and the NIFS wildfire perimeter. I mainly used the black and white image to do my interpretation since heat sources appeared more distinct on it than on the color image, possibly because the heat has cooled to a low level and is providing a weak IR signal. There was one small pocket of scattered heat. Most of the isolated heat sources were very small and consisted of only a few pixels.
