Comments /notes on tonight's mission and this interpretation: I started with the previous IR file: 20191019_0044_Decker_HeatPerimeter.shp as requested by the incident. There were no large changes to the exterior perimeter, only creeping edges in small locations. There were slightly larger changes to the interior islands. These are continuing to have heat enter them. The area is continuing to cool, with smaller and fewer intense heat areas and more isolated and scattered heat sources. End – 8723 Acres Start –8705 Acres (area of shapefile) Growth – 18 Acres Questions, comments, please contact the IR interpreter via the info above.
