<b>Comments /notes on tonight's mission and this interpretation:</b> Per GISS instructions, I began mapping from the latest NIFS perimeter.  The heat perimeter grew by 14 acres.  There were a few small pockets of intense heat along the eastern flank of the fire. About three-quarters of the fire interior was scattered heat with isolated heat within the central interior. There was some heat outside the main perimeter in the bowl at the very northeastern end of the fire as well.
