Fire Behavior Forecast

<u>Forecast No. 35</u>	<u>Prediction for Day Shift</u>
<u>Name of Fire: Big Turnaround Complex</u>	<u>Shift Date: May 24, 2007</u>
<u>Time and Date Forecast Issued</u> <u>1800 hrs 5/23/2007</u>	<u>Signed : Stewart Turner</u> <u>Fire Behavior Analyst</u>

Weather Summary (See Detailed Weather Forecast in the IAP):

Partly cloudy and breezy today with temperatures reaching the mid 80's. Minimum relative humidity will range from 36-42%. East winds will range from 12-16 mph sustained in the afternoon. A Haines index of 3 and a dispersion index of 71 are forecast.

General Fire Behavior: Critical fire weather is predicted for today. Dry fuels and stiff winds will overcome the effect of the recent scattered rain and increased humidity, expect to see very active to extreme fire behavior with any head fire. Expect moderate fire behavior after the morning inversion breaks around 0930. Fire behavior will increase to active by 1100 and very active during the peak hours 1600 through 2000 hrs. There is a potential for extreme fire behavior from 1800 to 1900 hours. Cloud shading will help moderate fire behavior, but as soon as the sun comes back out expect the activity to pick up. The scattered rain only diminishes the fire behavior for a short period of time. During peak hours swamp shrub and swamp bay fuels will burn intensely on the surface producing 8 to 15 foot lengths and spread rates of 10 to 12 feet/minute. Brisk east winds will facilitate torching and short range spotting out to 100 yards. The swamp fuels will produce moderate backing spread rates of 2-4 feet/minute. During peak burning hours, pine fuels will spread at 60-80 feet/minute with very high intensities in the palmetto/gallberry rough (15-30 ft flame lengths). Single tree and group torching in open canopy pine can produce spotting out to 300 yards. Young, closed canopy pine plantations (5-10yrs) have the potential to support sustained crown fire. Probability of ignition will be 70% during the peak burning period.

Specific Fire Behavior:

Branch I: Needle cast and rekindle will continue to cause control problems in this branch. Needle cast has filled in containment lines providing an escape path to green fuels for any reburn occurring near containment lines. Low to moderate intensity burnout along portions of the swamp edge break from DIV D to the branch break has created a high potential for reburn.

Branch II: Extreme fire behavior was observed during yesterday's burn out. This was ignited from the line allowing a head fire to develop to the west. The fire edge will continue to back to the East in DIV G-J. Backing spread during peak hours in the swamp shrub will range from 2-4 feet/minute moving near 1/3 mile per day. DIV K will continue to experience reburn in the needle cast.

Air Operations: Inversions will persist until 0900. Expect heavy smoke production from interior burning from 1300 to 2000 hrs.

Safety:

Gusty winds around thunderstorms may cause erratic fire behavior. Aircraft may not be able to work because of thunderstorm activity. Don't count on aircraft being able to fly to help you out of a bad spot.
