Fire Behavior Forecast

<u>Forecast No. 33</u>	<u>Prediction for Day Shift</u>
<u>Name of Fire: Ga Bay Complex /Sweat Farm Road</u>	<u>Shift Date: Wednesday May 23, 2007</u>
<u>Time and Date Forecast Issued</u> <u>1900 hrs 5/22/2007</u>	<u>Signed : Gary Curcio</u> <u>Fire Behavior Analyst</u>

Weather Summary (See Detailed Weather Forecast in the IAP):

Expect a **“very significant”** increase in afternoon windspeeds as the marine influence extends inland. The windspeeds are approaching the level when Bugaboo Scrub made its 12-mile run in an afternoon. Afternoon 20-foot winds out of the **“east”** will range from **15-20 mph with gusts to 25mph. Minimum RH** will range from **32-43%**.

General Fire Behavior: Fuel moistures continue to be at historic lows for both dead and live fuels. Heavy dead fuels and the live flammable green shrubs coupled with the unfavorable weather conditions today make all fires serious potential for new & rapid growth. Rates of spread can be extreme. There is high potential for spotting that will rapidly generate new fire starts. Any surface fire can quickly get up into the crowns of the pine plantations.

Today's inversion is light and its effect gone by 0830. Expect fire activity to start at 1100 hrs. Extreme fire behavior is likely in all fuels (Pine Plantations/Southern Rough and Swamp shrubs). The time period for peak active burning is 1500 to 2000 Hrs. Following sunset, fire spread will slow as windspeeds decrease. However, RH recovery will be weak and permit burning into the night. Spotting out to ½ mile can be observed in the swamp shrub fuels and ¼ mile in the pine fuels.

Specific Fire Behavior:

Sweat Farm: Divisions WB, & WC and Bugaboo Scrub: Divisions WG, WH & WI - Strong east winds increase the potential for slop-overs, or break-overs as runs out of the swamp are generated through the day. New spot fires can be easily start and spread rapidly in adjacent southern rough and young pine plantations.

Kneeknocker: Any sleepers will continue to be a threat. The shrub fuels where they have been scorched can very easily move to the crowns and generate new spot fires.

Roundabout: Continued organic soil burning continues to be a concern. Strong winds will foster re-burn potential. Any needle cast or browned shrub fuels are prime candidates for re-burn throughout the afternoon.

Initial Attack: With the strong east winds developing through the day, fire starts can develop fast in all fuels. These winds can fan many reburns in the needles cast stands and / dead shrub areas.

Air Operations: With the light inversion smoke will not limit aircraft. Smoke production is expected to be plentiful but winds will keep visibility clear. The western perimeters of the fires will be impacted by smoke production. Winds speeds & gusts need to be monitored.

Safety: Take the time to repeatedly assess your fire perimeter's weather & the fire's behavior. We need to be alert when all fires' transition from just active too extremely active. At all times know where your escape routes are, and know, that you can reach them.

☐ SAFETY MESSAGE

Incident:

Georgia Bay Complex

Date:

May 23, 2007

Time:

Day & Night Shift

Major Hazards and Risks:

- Transition
- Fire Behavior
- Snags
- Air Operations
- Reburn Potential
- Driving

NARRATIVE:

Transfer of command beginning this shift! This is always an opportunity for confusion; be sure to know who you are working for and in what area. Check radio communications at start of shift; don't wait till you really need it to discover you have a glitch.

Stronger winds can push fire even though higher humidity values are predicted. The history of this incident demands that everyone be fully aware of the predicted fire behavior. Maintain LCES at all times!

Driving continues to be priority. The best solution to most driving hazards is to simply reduce our speed. Be alert to varied speed limits in and around town and ensure that all incident personnel are in compliance with all traffic laws!

When the opportunity arises to utilize aircraft, please remember to adhere to the basic air operations safety guidelines. Ensure that communications are maintained (**know your air to ground frequency**) and that proper distance is given to working aircraft. Stay clear of all dip sites.

Predicted winds can produce snag problems, be alert when working around them. Post lookouts if needed.

Needle cast is still producing reburn potential. Keep this in consideration when evaluating escape routes and safety zones.

SAFETY OFFICERS: Michael Huffman, Mark Luellen, Ronnie Hamm, Harry Kepler, Steve Snider, Tim Sampson, John Orton, Andy Meadows, Larry Miller, Pete Stewart, Rodney Bell, Jerry Dombrowske, and Paul Boucher
