

KMZ Info:

There are two KMZ files in the NIFC ftp site:

Jarosa Base Data.kmz: This is made up of all relevant base data extracted from the Santa Fe NF corporate database dated 2011. It also includes some data from the Pacheco fire database. It also includes fixed weather station data from the National COP that was updated in January of 2013.

This file should not change much and can be downloaded once and used for the life of the incident.

Jarosa Inc Data.kmz: This file contains the dynamic data that the Incident creates. This includes the IR data and the incident GIS (FIMT) data. Check the "Last Modified Date" on the ftp site to ensure you have the most current file. This file is updated daily or when incident data becomes available.
