Comments / notes on tonight's mission and this interpretation:

This was the first IR scan for both fires. They were both flown within one scan box. I could not post to NIFS due to access issues.

Beehive - 2077 Acres

There was intense heat along the fire perimeter, predominantly on the eastern and southern flanks with abundant scattered heat throughout the interior. There was no isolated heat to map.

Corral - 77 Acres

There was no intense or isolated heat and only scattered heat throughout the interior of the fire.
